Looks like a harmless Windows Help Viewer sample that was thrown there as a dirty trick. But I remembered that I had thought so, because I was trying to run other application using it with System Restore. So, I tested it again and I confirmed that it's really false because once someone tried to launch that sample, it gave the message "You are about to install a sample. Choose whether to allow this. You are about to install a sample. Choose whether to allow this.", and in that moment I thought that the Beast hackers had decided to run applications as helper samples. So, I tried to install other programs as an example and I always reported me about a few helper apps, so that's why I decided to check which one of them is the Beast one. And, well, it's Geneforge, by the way. You can't install anything because the installer is locked from a main executable (MS07-068). When you try to launch it, you'll be asked to confirm that you want to quit the software. beast 2 is free software licensed under the gnu gpl. it is distributed in the form of an archive file containing a single file containing several.exe files. upon execution, the client program extracts the beast 2 core from the archive, and subsequently launches the server program. the server program performs the actual analysis, and returns its results to the client program. beast 2 can use several tree topologies (species trees) and several substitution models (analysable as dna, protein, or codon data). these are specified on the command-line to the server program, and they are the only required arguments. the server program itself performs the actual analysis, and returns its results as standard output. there is no need for the client program to perform any post-processing. the output is standard output and can be redirected to a file, e.g. to a graphical file-browser, or the standard output can be redirected to a

logfile. beast 2 was designed to analyse data from real-world projects, including the analysis of both new and previously known data. data analysis is facilitated by options for estimating the location of ancestral nodes (specified using root-to-tip calibrations), species tree estimation (with a known species tree), and the analysis of some subsets of the data, such as homologous sites in a protein alignment. beast 2 uses bayesian mcmc to explore tree space, with a prior specified by the user and a calibrated tree. it provides a variety of options for specifying prior information, such as for the substitution model, root calibration, and time-measurement. beast 2 includes a graphical user-interface for setting up analyses and a suit of programs for analysing the results. 5ec8ef588b
